

Project Title: VLAN Environment Implementation and Membership Allocation

Objective:

The project aims to set up a Virtual Local Area Network (VLAN) to improve network segmentation, security, and management. VLAN memberships will be assigned by department and role for efficient network performance and security.

Scope:

- Design and configure a VLAN environment.
- Allocate VLAN memberships by department
 - Based on the case from last quiz of mid term exam, and more cases if needed
- Optional objective: Implement inter-VLAN communication.

Tasks:

1. **VLAN Design**
 - Identify departments for VLAN segmentation.
 - Assign VLAN IDs to each department.
2. **Network Configuration**
 - Configure switches to support VLANs.
 - Set up trunk ports for VLAN communication.
3. **Membership Assignment**
 - Allocate devices to the right VLANs based on role/department.
 - Create Access Control List to manage inter-VLAN access.

Aimed features to observe:

- Enhanced network performance through segmentation.
- Improved network security by restricting unauthorized access.
- Easier network management and scalability.
